

Chromatic Scales?

Seven audio features rescaled across all keys. Keys with a bold colored border scored at least 1σ above the median on one feature and earned a personality label.

Chromatic Scale, C4 $\rightarrow$ B4 (coloured by personality label)

8 of 12 keys have a clearly distinctive audio profile ($z > 1\sigma$ above median on at least one feature). The remaining keys fall within the normal range. Read left to right, C through B.

● Median (dashed) ● Significant above ○ Significant below Bold border = distinctive · Dim = average

The Personalities, Explained

A key earns its personality when one audio feature is ≥ 1 standard deviation above the median (after min-max rescaling). **Not every key has a personality**; some are simply average across all features.

Personality	Feature	Why This Name?
The Groover	Danceability	These keys attract the most groove-friendly, steady-beat tracks. You'd hear them at a dance party.
The Silent Type	Instrumentalness	Vocals are unusually absent. Favoured by ambient, classical, and lo-fi artists.
The Stage Lover	Liveness	Recordings that capture the feel of a live performance. You can almost hear the crowd.
The Storyteller	Speechiness	Word-heavy: rap, spoken word, storytelling. The vocals carry more than the melody.
The Optimist	Valence	The happiest keys. Music theory aside, these tracks just sound sunny.
